

VoIP Trunking from CBTS

A flexible foundation for modern business communications

In today's highly mobile, cloud-enabled world, businesses need a flexible and scalable communication platform. Consumers still expect the same level of consistent accessibility from the businesses they rely on daily. Phone numbers offer a fixed point of contact and a basis for consumer trust. Voice services also form the backbone of internal communication, enabling your employees to collaborate with each other and strategic partners in real time.

Voice connectivity is too valuable an asset to be limited by legacy technology. Voice over IP (VoIP) provides a scalable, portable, and cloud-friendly alternative to legacy phone service, ensuring that your business can adapt to change without sacrificing connection.

Agile voice calling

CBTS VoIP Trunking is built on a next-gen, enterprise class architecture. With geographic and equipment redundancy built in, customers can take comfort that your connectivity is safe, reliable and feature rich.
